mean ± seed SD

DCI-C asks whether recoverable language information is concentrated in a few learned coordinates (1) or spread across many (0); here it uses pair-blocked permutation importance on the untouched test pairs.
DCI-I is held-out accuracy for predicting the direction of the language concept from the learned code (1 is perfect; dotted 0.5 is chance). Predictors are fit on train and selected on validation; faint lines are the three SSAE seeds and bold lines are mean ± seed SD.
The x-axis is the configured target; target 0.02 ended at mean |h|≈0.0229 and was not fully feasible.
