ENG→French identifiability overfitting: train / validation / test

Train (fit)

Validation (selection)

Test (untouched)

MCC-P

DCI-C

DCI-I

MCC-S

R^2

Seedwise MCC

seed 0
seed 1
seed 2
mean ± seed SD

L1 target

MCC coordinate mappings, R^2 linear maps, and seed-to-seed coordinate alignments are fit on train and frozen for validation/test. Spline GAM is the DCI probe: it was selected globally by highest mean validation DCI-I (never test), then frozen across all panels; DCI-C uses pair-blocked permutation importance within the displayed split, followed by identifiability_guard completeness.
Faint lines are three SSAE seeds (three train-frozen seed pairs for Seedwise MCC); bold lines are mean ± sample SD. Seedwise MCC uses encoder responses, not decoder weights. Validation is selection-involved; only test is untouched.
The 0.02 runs ended at mean $|h| \approx 0.0229$ and were not fully feasible.
